Promising Altcoins Quick Analysis

The following altcoins are not in any particular order, to us they're all promising

Litecoin (LTC)

["Aliant Payment Systems, a U.S. based provider of merchant services and credit card processing, announced today that it is now offering its merchants the ability to accept Litecoin payments."](#)

With the upcoming LitePay, and further adoption of the lightning network we're very optimistic on Litecoin's future.

Neo (NEO)

NEL a Neo development group recently released their development report and in it they said that they're speeding up their development for NEO - you can view the full report [here](#). We're very optimistic on Neo as it has extremely strong fundamentals and team.

Ethereum (ETH)

Ethereum's official Mist wallet is updating soon to allow for instant network connection which means you'll be able to see your wallet balances and transactions instantly. Check out their official posting on [GitHub](#). Also keep an eye out for Raiden Network releasing.

Monero (XMR)

Monero meetup in Berlin on February 8th, Cake Wallet is pushing out an update soon on iOS. Check out more news on [Reddit](#).

Waltonchain (WTC)

Walton has a lot of things upcoming for Q1 including:

- Making the genesis block and parent chain operational
- Converting from ERC20 token to WTC coins
- Operational release of masternodes
- Airdrop reward payout to masternodes

View more in regards to Waltonchain on their [Reddit page](#)

ZenCash (ZEN)

ZenCash community call tomorrow at 1pm EST, check out Zen's Reddit [here](#). The reason we are optimistic about ZenCash and Monero is that they're both anonymous tokens that a lot of the market is turning to in these times of mounting regulations.

Zilliqa (ZIL)

Zilliqa, a coin that we recently reviewed, has been added to the [Cheddar app](#). ZIL is not on very many exchanges currently so watch out for it getting added to a major exchange.

0x (ZRX)

0x is one of the early decentralized exchanges that came out on the Ethereum platform and it is primarily meant for the trade of Ethereum tokens, decentralized exchanges such as 0x provide solutions to some of the problems that plague centralized exchanges which you can read about in [this article](#).

Nebulas (NAS)

Nebulas is trying to build the google of blockchains - creating a searchable blockchain platform as well as one that is byzantine fault tolerant is certainly a tough task but the NAS team lead by former members of NEO is very strong. Although it is partly based in China - they are headquartered in San Francisco and are actively building out their platform as well as attending events. We recently did an analysis on NAS and we're very optimistic in regards to its future.

Note:

This is just a list of some of the altcoins that we think are promising - we weren't paid to shill any of these coins nor are we advising you to buy any of these coins. The thoughts expressed here are solely our own.
